Monitoring T837/CIRT Dashboard

This page describes how we use a particular Pega dashboard to monitor T837, CIRT, and keyword generation processes. These processes are often called "preadjudication claims processing," collectively.

> We, as a team, often colloquially just call this dashboard "The Pega Dashboard" or simply "Pega," but bear in mind when talking to other teams that Pega is actually a software development platform for writing other software, such as T837 and CIRT processes, and products that other teams own, like Interact.

Table of Contents

- The PEGA Dashboard has 2 pages we use to monitor the status of claim loading:
- DASHBOARD
  - T837 and CIRT High Level

Other helpful resources

Processes that are associated with claims processing runbooks are listed below:

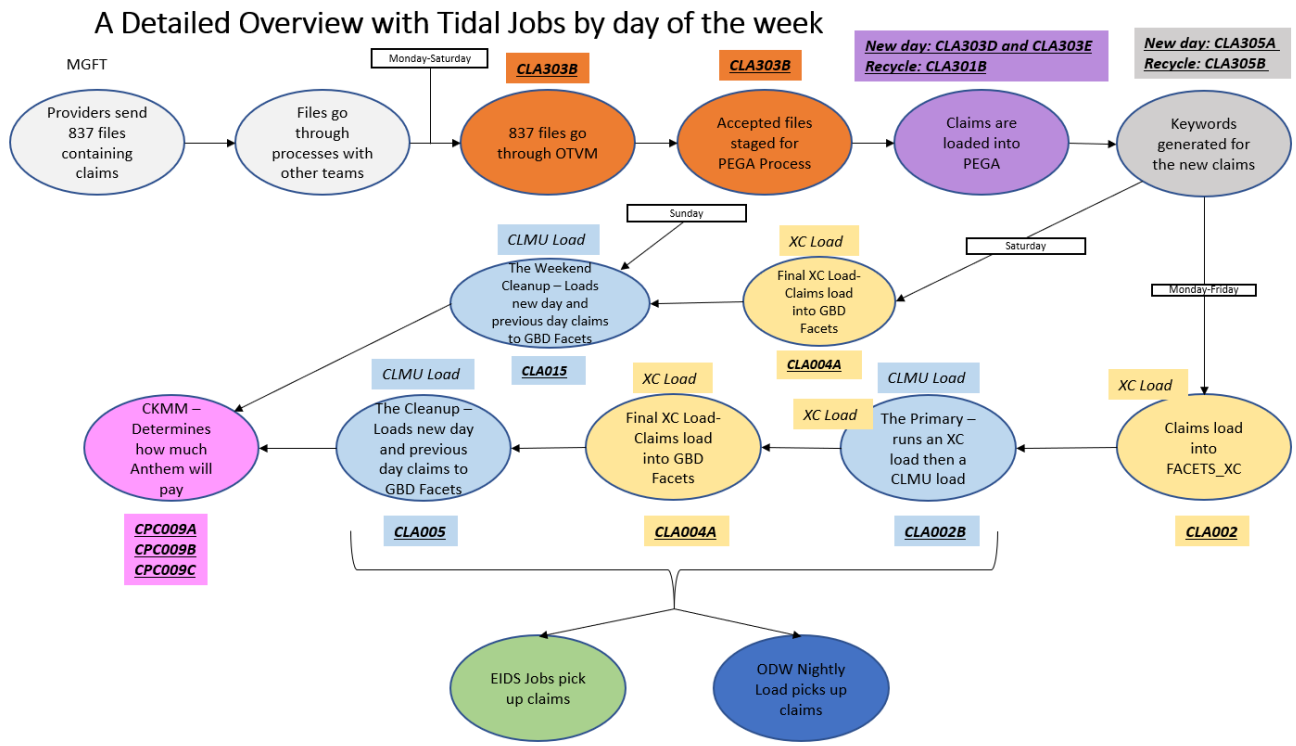
Claims Process Overview and Flowchart

Below is the overview of the claims loading process.

Before claims go to the PEGA Dashboard, they first go through OTVM where they are checked for HIPAA compliance. If they are accepted, the files are then staged to be loaded to PEGA here:

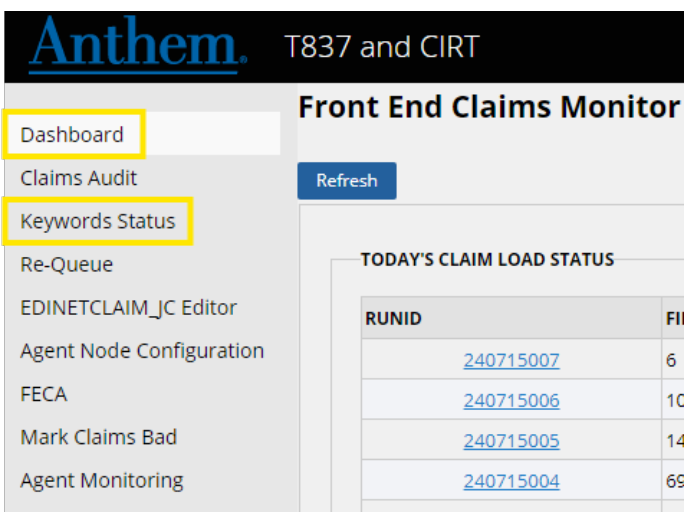
- \\VA22PWVISS315.corp.agp.ads\POSTOFFICE\837_IN\OTHER\Staging

If we see files in this file path, it's good. It means **`CLA303D`**, **`CLA303E`**, and **`CLA301B`** will have files to pick up and load to PEGA. Each of these jobs picks up different types of files from this folder, based on naming convention.



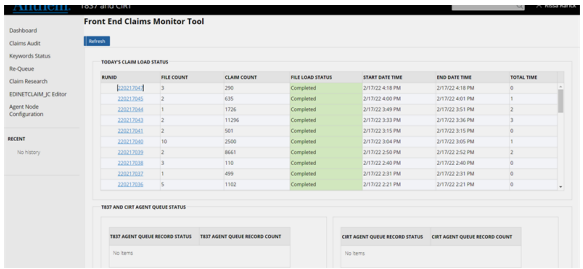
The PEGA Dashboard has 2 pages we use to monitor the status of claim loading:

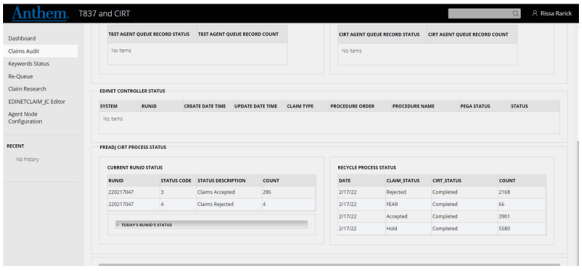
1. Dashboard
2. Keyword Status



These two pages are described in the below sections.

DASHBOARD





T837 and CIRT High Level

Process Summary

The claims processing procedure consists of two main stages: the 'T837 Mapping' process and the 'CIRT' process. Any incoming claim that comes out of OTVM must go through these processes before it can continue with further actions like keyword generation, loading to Facets, adjudication, and payment.

T837 Mapping Process

The first step, T837, involves loading new 837 files into EDINET. This lays the groundwork for the incoming claims to be processed.

CIRT Process

Next is the 'Claim Intake Repair Tool' (CIRT) process. This step is enacted once claims have been loaded into EDINET and must be completed before any additional claims processing can occur. Interestingly, the CIRT process can begin even while other claims from the same run are still in the loading phase via the T837 process, leading to some overlap.

During CIRT, each claim is either accepted or rejected:

- Rejected Claims: If a claim is rejected, something was found to be incorrect in the claim data. This could be an empty or invalid provider ID, Member ID, date of birth, claim date, service date, incorrectly routed to the wrong insurance company, among other possibilities.
- Accepted Claims: Conversely, a claim is accepted if it passes all the rejection checks, and no flaws are flagged.

This double-stage procedure allows our system to process and verify each claim effectively, setting the stage for further actions as mentioned above.

Typical sequence of events of a given run (or batch) of claims loading and processing goes like so:

Initiation

- CLA303D begins when it meets the time and job dependencies.
- It then instructs Pega to load a new batch of claims via CLA303D_0030_CALL_SOAP_SCRIPT.

70397303	CLA303D_1D00_PEGA_LOAD_EDI (1)
70407585	CLA303D_0010_PEGA_DROP_FILES (1)
70407581	CLA303D_0020_SET_FLAGFILE (1)
70407580	CLA303D_0030_CALL_SOAP_SCRIPT (1)
70407576	CLA303D_0035_UpdateScanClmTracking40 (1)
70407575	CLA303D_0040_WAIT (1)

Claim File Pickup

- Pega starts retrieving 837 files, following a specified naming pattern from a location (`\\VA22PWVISS315.corp.agp.ads\POSTOFFICE\837_IN\OTHER\Staging`).
- This begins the T837 process, creating a new row with a RUNID in the Dashboard's "Today's Claim Load Status" section.

TODAY'S CLAIM LOAD STATUS

RUNID	FILE COUNT	CLAIM COUNT	FILE LOAD STATUS
240715007	6	602	Completed
240715006	10800	20071	Completed
240715005	14966	20386	Completed
240715004	69920	99140	Completed
240715003	87691	195404	Completed
240715002	35927	73608	Completed
240715001	72505	74580	Completed

- Note: The pickup location is shared with other processes, so not every file there is used by this process.

Claims Processing

- As the first claims from T837 arrive in EDINET, the CIRT process starts processing these claims. This is where business rules are
- For most of the batch run, T837 and CIRT processes are concurrent.

CIRT Process Tracking

- The start of the CIRT marks multiple rows popping up in the Dashboard's "`Current RUNID Status`" under "`Preadj CIRT Pro`

PREADJ CIRT PROCESS STATUS

CURRENT RUNID STATUS

RUNID	STATUS CODE	STATUS DESCRIPTION	COUNT
240715007	3	Claims Accepted	602

DAY'S RUNID'S STATUS

- These rows count claims in particular CIRT statuses. During CIRT, claims begin in status 1 "Scheduled for CIRT Processing", proc Processing", and end up accepted (status 3) or rejected (status 4).

T837 Process Completion

- Once done, T837 merges its two RUNID rows (completed and in progress) into one row in the Dashboard's "Today's Claim Load S
- This row shows "Complete" in the "File Load Status" (in green), and an entry appears in the "End Date Time".
- Note: when the row shows "Complete," this means it is complete in T837 ONLY.

Post T837 CIRT Processing

- CIRT continues after T837 ends until all claims end in either accepted or rejected statuses.
- Status 1 and 2 rows disappear.

Batch Wrap Up

- After CIRT, Pega creates a `ClaimsProcess.done` file and adds a row for the current RUNID in the "Keyword Status" tab.
- The batch queues for keyword file generation for final claim-load to Facets XC, CLMU adjudication, and CKMM payment.
- The `ClaimsProcess.done` file stability initiates the next step - `CLA303D_0035_UpdateScanClmTracking40`.

Re-run or Conclusion

- After CLA303D and subsequent steps complete normally, if it's before 5:00 PM, CLA303D reset its time dependency by adding five
- If it's at or after 5:00 PM. It remains in the same status, and no rerun occurs.
