Keywords

Original Author: Murali Radhakrishnan

There are several keywords that are populated and used by Trizetto Batch jobs. The Front-End, or Pre-Adjudication, keyword is called the External Claims Format Keyword. This keyword is a flat file generated by an ETL process written in Informatica, containing information submitted on the claim in the external claims format. For details on the segments included in the keyword, please refer to the FACETS ORM documentation.

These are the Tidal jobs that are used to generate keywords for Pre-Adjudication.

1. CFT305C_1D00_AUTO_KEYWORD_AM - Runs from 130 AM to 645 AM and generates keyword for the new day claims in EDINETCLAIM_PROCESS DB.
2. CFT305B_1D00_AUTO_KEYWORD_RECYCLE_ALL - Runs at 7 AM and generates keyword for the claims that were marked for Facets (ClmRoutingFlag = 'F%' in the recycle process. This is from EDINETCLAIM DB.
3. CFT305A_1D00_AUTO_KEYWORD_AM - Runs from 8 AM to end of the day. This does the same job as CFT305C.
4. CFT305D_1D00_AUTO_KEYWORD_RECYCLE_RUNID - It is an ad hoc recycle keyword process. This is used to generate recycle keyword for operator-specified RunIDs from EDINETCLAIM DB.

All of these jobs use the same Informatica workflow to generate the keyword. Therefore, when one of these is running, attempting to insert another instance of a different job will cause it to fail, as an instance would already be running. If we are planning to insert a new instance of CFT305D, we must first put any currently running keyword job on hold before inserting it. Once CFT305D is completed, we can then release the job that was put on hold.

New Day keyword vs Recycle Keyword:

The new day keyword is generated from the EDINETCLAIM_PROCESS database. It uses the EDINETCLAIM_PROCESS.KEYWORD_RUNID table to identify the Run ID for which the keyword needs to be generated. It pulls the first Run ID that has the COMPLETE_FLAG set to 'N' and generates the keyword for that Run ID. Once the keyword is generated, the flag is updated to 'Y' in the table. If there are no Run IDs with the COMPLETE_FLAG set to 'N', it simply runs and completes without doing anything.

The recycle keyword is generated from the EDINETCLAIM database. It uses the EDINETCLAIM_PROCESS.Recycle_RunId table to identify the Run IDs for which the keyword needs to be generated. Some claims might not get processed on the new day and are processed during the recycle CIRT process (CFT301B). At the end of claims processing every evening, we perform a Data Move (CFT302B), which transfers the New Day claims data from EDINETCLAIM_PROCESS to EDINETCLAIM. This is why we have a keyword process that operates from EDINETCLAIM. It is the same process, except it runs from EDINETCLAIM.

Some History:

We initially had only CFT305A for generating the keyword. However, CFT305A is dependent on CFT305B, which in turn is dependent on several other jobs. CFT305B is scheduled to run only at 7 AM. Due to this, the new day keywords were not generated until the recycle keyword was generated. This resulted in a very small number of claims in the CLMU Primary. To address this, we created a new instance, CFT305C, which generates the keywords as soon as claims processing starts and stops at 6:45 AM, allowing the recycle keyword to run. This helped us have more keywords for CLMU Primary.

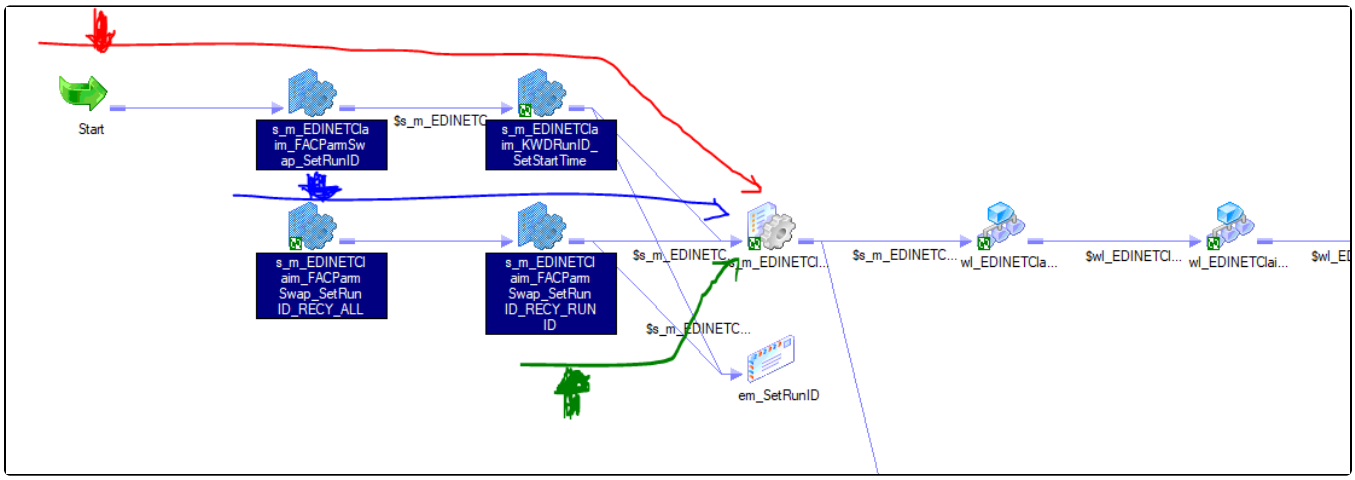
CFT305B vs CFT305D:

Both CFT305B and CFT305D serve as recycle keywords. CFT305B operates as part of a schedule running from Monday through Saturday, while CFT305D belongs to an Ad-Hoc group. Although both keywords share similar functionality, the primary difference lies in the claims they include.

CFT305B conducts a comprehensive analysis by extracting all claims from the EDINETCLAIM database, focusing on those with a `ClmRoutingFlag` begin ning with "F%" and a `StatusCurrentLocation` that is either blank or NULL. Essentially, it performs a full database sweep to compile the list of claims.

On the other hand, CFT305D is more selective. It also retrieves claims from the EDINETCLAIM database with a `ClmRoutingFlag` starting with "F%" and a `StatusCurrentLocation` that is blank or NULL. However, it limits its extraction to claims with `RunIds` present in the Recycle_RunId table. Of note: the operator (GBD IT Env Ops or CIFT) defines the Run IDs for which CFT305D will generate a keyword.

Here is the screenshot of the Keyword workflow.



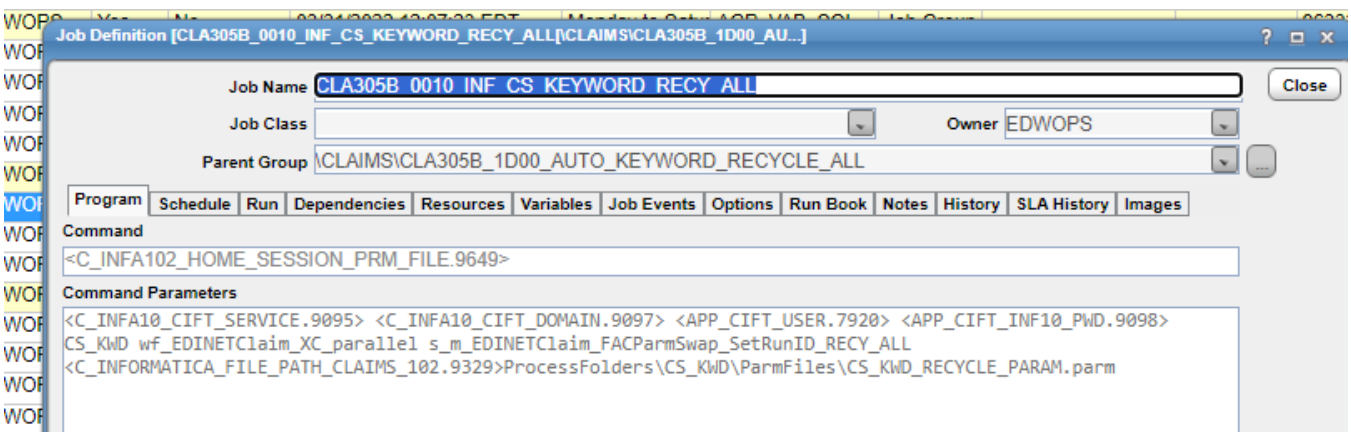
In the screenshot referenced, different colored lines indicate distinct workflow paths:

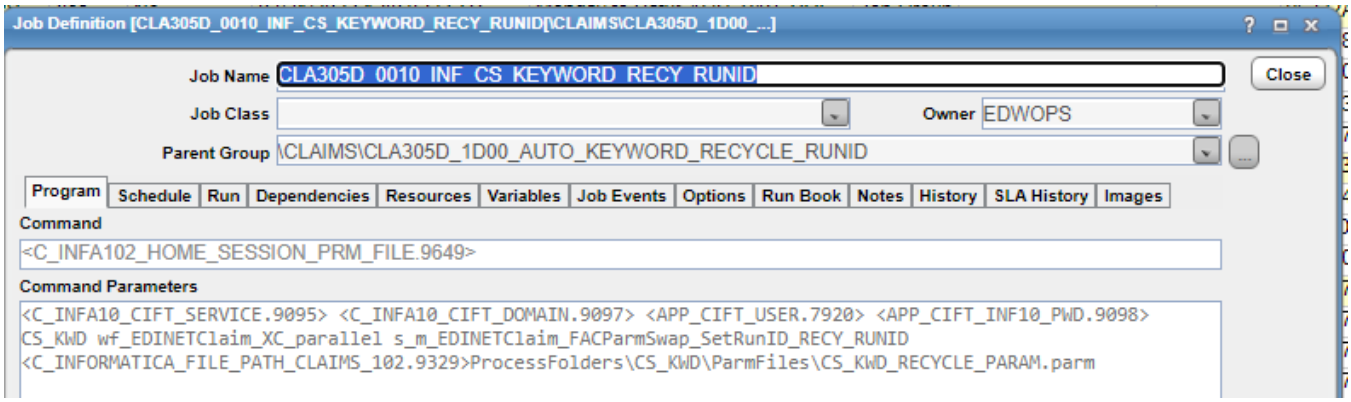
- **Red Line**: Represents the path for the new day keywords, CFT305A and CFT305C.
- **Blue Line**: Indicates the path followed by the Recycle ALL keyword, CFT305B.
- **Green Line**: Shows the path for the Recycle RUNID keyword, CFT305D.

The process begins with the first session, which extracts the RunId from the `EDINETCLAIM_PROCESS.dbo.KEYWORD_RUNID` table, guiding the new day process via this table.

The second row's first session identifies the claims to be included in the recycle keywords. The second session in the same row then inserts these RunIds into the `EDINETCLAIM_PROCESS..Recycle_RunId` table, explaining why recycle keywords bypass the `KEYWORD_RUNID` table.

The key distinction between CFT305B and CFT305D lies in the initiation point of the workflow.





CFT305B looks for all claims in the entire database where as CFT305D only pulls the claims that are present in the Recycle_RunId table. When we insert a new instance of CFT305D we should also truncate and insert the runids for which we need to generate the keyword. This is usually done when we skip the encounter keyword when it runs long and we generate it the next morning using CFT305D.

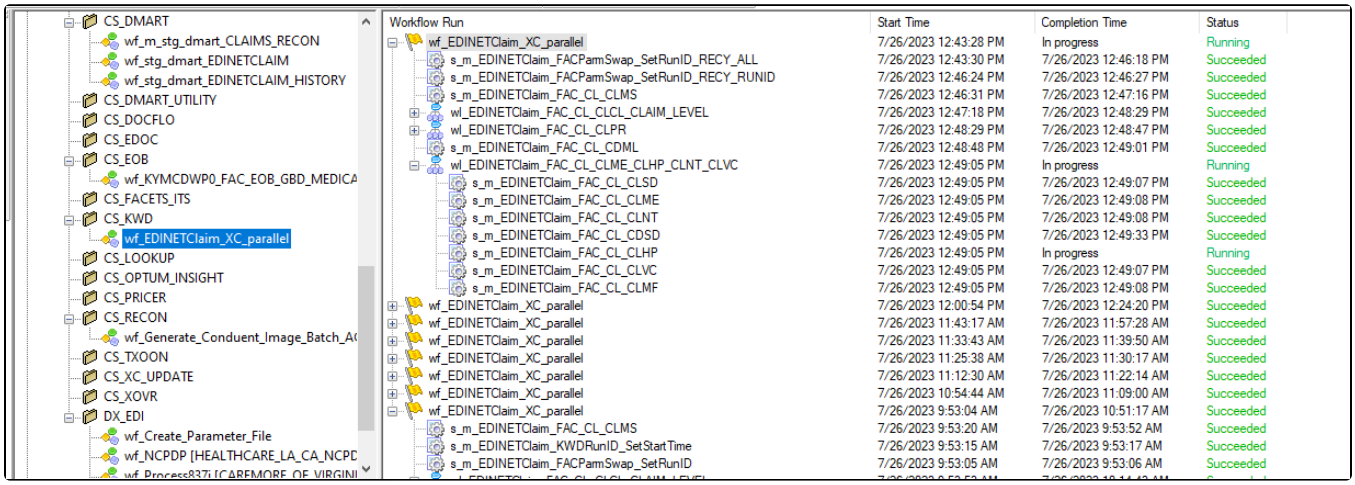
Where are the keyword files placed:

The keyword files is generated by the Informatica job step and is placed in the \\va01pstodfs003.corp.agp.ads\apps\Informatica10\PROD\Claims\ProcessFolders\CS_KWD\TgtFiles folder. The move step then moves the files to \\va01pstodfs003.corp.agp.ads\apps\Facets\Prod\TZG\Files\GBFAC01P\INBOUND\KWD\CLAIMS\INPUT folder.

Monitoring the Keyword in Informatica Monitor:

To monitor workflows in Informatica Cloud Data Integration for PowerCenter, you need to connect to the `REPO_GBD_PROD_CLAIMS_ASH_PCC` repository. Navigate to the `CS_KWD` folder. When you double-click on this folder, it will display all the workflows currently running within it. The monitor will indicate which step is active or whether the workflow has been completed.

In the event of a failure in the keyword process, access the monitor to identify the session where the failure occurred. If a workflow is running longer than expected, check the session's start time to determine which specific session is experiencing the delay.



How to Identify Which Keyword Included a Claim:

There are several methods to determine which keyword included a particular claim.

1. **Query the History Table**:
   You can query the **`EDINETCLAIM_HISTORY.dbo.T837ClaimStatusHistory`** table to track the claim's history in EDINET. **IMPORTANT**: Only query this table using `CLMINFOID`. Avoid using any other fields, as the absence of indexes will cause database blocks.
2. **Ordering Records**:
   When querying, order the records by **`ClmInfoId`** and **`HistInsertDate`**. The claim may be included in either a new day keyword or a recycle keyword.
3. **Identifying New Day Keywords**:
   If a claim was included in a new day keyword, the history table typically won't show **`ClmRoutingFlag`** values such as S1/S2/P*/H*. Instead, it will display **`F*`**, with **`StatusCurrentLocation`** as blank.
4. **Accessing Keyword History**:
   Navigate to the keyword history folder **`\\va01pstodfs003.corp.agp.ads\apps\Facets\Prod\TZG\Files\GBFAC01P\INBOUND\KWD\CLAIMS\HISTORY`** for the relevant date. Locate and pull the file associated with the RunId that corresponds to the claim.

- Use UltraEdit to open the file, as it may be large. Search for the file using `AGPClmNbr`. Each claim starts with a `@pRecType="A"` segment, so you need to examine the data from one A segment to the next to gather the claims information. In the keyword file, you'll encounter numerous entries and segments labeled as `@RecType=''`. Particularly, look for entries like `@RecType='A', @pA010`.
- If the claim wasn't included in the new day keyword, it might have a `ClmRoutingFlag` value other than F* on the day of the load, changing to F* the following day or shortly after. If the recycle keyword job (CFT305B) ran after this date, the claim would appear in the recycle keyword for that day. However, if the job ran before this date, the claim would be included in the recycle keyword the next day.
- Please refer to the following example for further clarification.

HistInsertDate	HostName	LastActivityDtTm	[redacted]	runid	[redacted]	TradingPartnerCD	StatusPayerID	EDICntlNbr	ClmRoutingFlag	ProcessCD	StatusCurrentLocation	StatusCD
2022-07-28 17:21:00	VA22PWPPEG402	2022-07-28 17:21:00		220728029		CONDUENT				M

The claim was loaded on 7/28 and initially marked as BAD, but it changed to F1 on 7/29. A new day claim would typically be included in the recycle keyword on the third day. Therefore, it would appear in the recycle keyword starting from 7/30. To verify this, go to the HISTORY folder for 7/30 and retrieve the keyword file named RECYCLE_ALL.

- Another method to determine when the keyword was generated for a claim is by checking the **`CLCL_INPUT_DT`** in the **`CMC_CLCL_CLAIM`** table. If the claim is in XC, query the **`FACETS_XC.CMC_CLCL_CLAIM`** table; if it's in FACETS, query the **`FACETS.CMC_CLCL_CLAIM`** table. The **`CLCL_INPUT_DT`** represents the date when the claim was loaded into XC, indicating when the XC00 Batch processed the keyword. The keyword would thus have been generated either on that day or the previous day if the keyword from the previous day wasn't processed.

- Once you determine the date, use the previously described method to identify which keyword from that day includes the claim. Occasionally, the claim may be part of the BATCH RECALL keyword from FACETS. You can apply the same method to identify the day the keyword was generated, but please note that the keyword name will differ.

Important Points to Remember about Keywords:

1. **Timing of New Day Keywords**: All new day keywords must be completed before the Data Move because they are pulled from the `EDINETCLAIM_PROCESS` database. The CFT303Y process includes sanity checks to ensure all keywords are generated by 7:30 PM. Do not mark it as complete until all keywords are successfully generated.
2. **Skipping Keywords**: If you need to skip a keyword that's running too long, you must first abort the operation and then update the `COMPLETE_FLA` to "Y" to effectively skip it. Simply marking the process as complete without this update will cause the keyword to restart, allowing CFT303Y to potentially finish while the keyword is still in process. This can lead to the Data Move (CFT302B) starting with incomplete data, resulting in errors and potentially failing the XC00 Batch.
3. **Running Restrictions**:
    - Keywords cannot run concurrently with CLA034, as both processes use overlapping tables involved in member and provider refresh tasks.
    - Do not run CFT305B if CLA007 steps 0005 through 0030 are incomplete or have been skipped. These steps update the claim statuses in XC/FACETS back to EDINET. If skipped, the `StatusCurrentLocation` for claims already loaded will not update, causing the recycle keyword to include them again and possibly fail in XC.
4. **Sequential Execution**: Keywords cannot run in parallel as they utilize the same workflow. If you need to introduce a new instance of a recycle keyword, pause the new day keyword, insert the new instance, and then resume the new day keyword once the recycle keyword completes.
5. **Dependency Management**: CFT305A will not start until CFT305B completes. If CLA005 is delayed for maintenance or other reasons, impacting CLA007, which CFT305B depends on, you should set CFT305B's job group and steps to complete, allowing CFT305A to start with the new day claims. This keeps the process on schedule. Once CLA007 step 30 is complete, you can rerun CFT305B, ensuring no other keyword is running simultaneously.

Keyword and Keyword Recovery

Keyword failures CFT305A

If you don't have permissions to do this locally, you can always log into VA1ECG03 and do so there.

If KWD fails for error: Override amount > 9

Severity Timestamp Node Thread Message Code Message

ERROR 6/20/2017 11:06:54 AM NODE03_AGP_PROD_VA01PINFAPP012 MAPPING CMN_1022

Database driver error...

CMN_1022 [dbo.pr_DIAG_ORDER

Microsoft OLE DB Provider for SQL Server: The statement has been terminated.

State: 1 Severity: 0

SQL Server Message: The statement has been terminated.

Microsoft OLE DB Provider for SQL Server: String or binary data would be truncated.

SQL State: 22001 Native Error: 8152

State: 14 Severity: 16

SQL Server Message: String or binary data would be truncated.

Database driver error...

Run the following query in EDIENTCLAIM_PROCESSING to see if reruns results over 9 characters in first column.

```
select len(override_amount), * from facparmswap fc

join t837claiminfo ci (nolock) on fc.clminfoid = ci.clminfoid
```

```
where len(override_amount) > 9
```

Correct the Override_Amount like 1126544.85 to 1126544.8 using the query below due to the amount being larger than 9 characters:

```
update t837claiminfo set Override_Amount = '<insert corrected amount here>' where clminfoid = '<insert clminfoid needing correcting here>'
```

Keyword Loading/Monitoring

Monitoring the Keywords

Keyword files are the output of the Claims Processing steps. These files are used to populate FACETS with the claims of the day. The Keyword files are created as the work product of the Controller, and are used by the Keyword workflow. The data contained is written to a database on FAC1P called FACETS_XC.

- The main Informatica job to monitor is the keyword workflow. It's information is:

  Version: Informatica 10.2.0

  Integration Service: IS_AGP

  Folder: CS_KWD

  Workflow: wf_EDINETClaim_XC_parallel

  Tidal Job: CFT305A

- This workflow will run every three to five minutes during the day. Most of the time, there is not a keyword file available for it to process, so it will start, run for about 10 seconds, and then terminate. The Controller job creates the keyword files, so when a keyword file is created, an entry in the KEYWORD_RUNID table is made. You can monitor this table for the days' keywords with the following query on EDINET1P Database.

```
--Monitoring the progress of the Keyword load.  This is the days'
--keyword queue.  If files are processed, the 'COMPLETE_FLAG is 'Y'.
select top 20 *
from EDINETCLAIM_PROCESS.dbo.KEYWORD_RUNID
where RunID >= (select min (runID)
from EDINETCLAIM_PROCESS.dbo.KEYWORD_RUNID
where start_time > convert(varchar(10), getdate(), 112))
order by RunID desc;
```

- Generally, the workflow processes claims at a rate of approximately 1000/minute. You can look at the value in FACETS_COUNT from the above query to get a rough estimation of how long the workflow/keyword load should take

Estimating runtime for Keywords Processing in Informatica

Use this query to monitor the average runtime for keywords processing in Informatica and runs on the Claims Dashboard in PEGA,

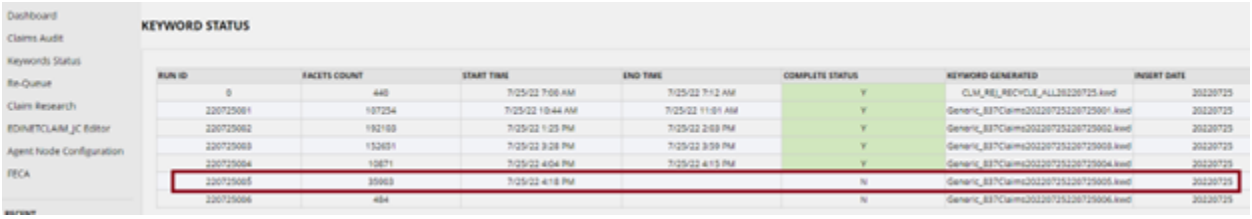
Keywords should be monitored often to ensure nothing is getting hung up in the Informatica process or it they are stalled.

Run the query Average Keyword:

```
; with cte as
(
select
datediff(minute, start_Time, end_time) as Duration
, case
   when FACETS_COUNT between 1 and 1000 then '1-1000'
   when FACETS_COUNT between 1001 and 20000 then '1001-20000'
   when FACETS_COUNT between 20001 and 40000 then '20001-40000'
   when FACETS_COUNT between 40001 and 75000 then '40001-75000'
   when FACETS_COUNT between 75001 and 100000 then '75001-100000'
   when FACETS_COUNT between 100001 and 130000 then '100001-130000'
   when FACETS_COUNT between 130001 and 175000 then '130001-175000'
   when FACETS_COUNT between 175001 and 200000 then '175001-200000'
end ClaimCntGroup
from edinetclaim_process.dbo.KEYWORD_RUNID where CAST(START_TIME as DATE) > CONVERT(nvarchar(10), GETDATE()-30,23)
)
select ClaimCntGroup, AVG(Duration) as Avg_Duration from cte
group by ClaimCntGroup
order by Avg_Duration
```

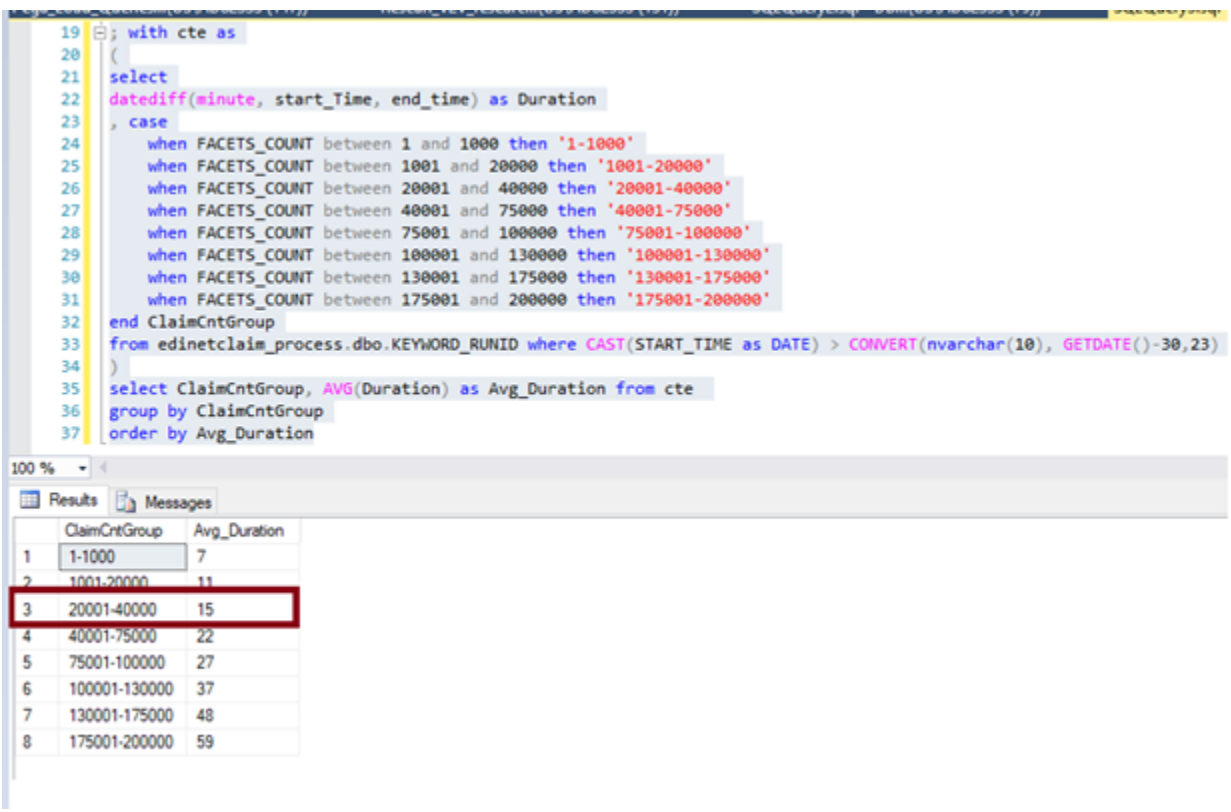
Example on how to use results:

1. The keyword that is running in this example would be almost 36K claims that you see on the Keyword tab in the Claims Dashboard in PEGA.



RUN ID	FACETS COUNT	START TIME	END TIME	COMPLETE STATUS	KEYWORD GENERATED	INSERT DATE
0	440	7/25/22 7:00 AM	7/25/22 7:12 AM	Y	CLM_REI_RECYCLE_ALL20220725.kwd	20220725
220725001	107254	7/25/22 10:44 AM	7/25/22 11:01 AM	Y	Generic_837Claims20220725220725001.kwd	20220725
220725002	192103	7/25/22 1:25 PM	7/25/22 2:03 PM	Y	Generic_837Claims20220725220725002.kwd	20220725
220725003	132651	7/25/22 3:28 PM	7/25/22 3:59 PM	Y	Generic_837Claims20220725220725003.kwd	20220725
220725004	10871	7/25/22 4:04 PM	7/25/22 4:15 PM	Y	Generic_837Claims20220725220725004.kwd	20220725
220725005	35963	7/25/22 4:18 PM		N	Generic_837Claims20220725220725005.kwd	20220725
220725006	484			N	Generic_837Claims20220725220725006.kwd	20220725

2. In the query results below the average for 36k claims would be 15 minutes give or take a minute or so. This should give you some idea on if the volume is running as expected.



```
; with cte as
(
select
datediff(minute, start_Time, end_time) as Duration
, case
    when FACETS_COUNT between 1 and 1000 then '1-1000'
    when FACETS_COUNT between 1001 and 20000 then '1001-20000'
    when FACETS_COUNT between 20001 and 40000 then '20001-40000'
    when FACETS_COUNT between 40001 and 75000 then '40001-75000'
    when FACETS_COUNT between 75001 and 100000 then '75001-100000'
    when FACETS_COUNT between 100001 and 130000 then '100001-130000'
    when FACETS_COUNT between 130001 and 175000 then '130001-175000'
    when FACETS_COUNT between 175001 and 200000 then '175001-200000'
end ClaimCntGroup
from edinetclaim_process.dbo.KEYWORD_RUNID where CAST(START_TIME as DATE) > CONVERT(nvarchar(10), GETDATE()-30,23)
)
select ClaimCntGroup, AVG(Duration) as Avg_Duration from cte
group by ClaimCntGroup
order by Avg_Duration
```

1	1-1000	7
2	1001-20000	11
3	20001-40000	15
4	40001-75000	22
5	75001-100000	27
6	100001-130000	37
7	130001-175000	48
8	175001-200000	59

Recycle Keyword

If a keyword will not finish during the normal time window, it may be necessary to process it the following day via the Recycle Keyword job. This is an automated job (it's already scheduled) that only requires the RUNID(s) in question to be configured.

configured.

- For the RunID in question, set the COMPLETED_FLAG = 'Y':

```
update EDINETCLAIM_PROCESS.dbo.KEYWORD_RUNID
set COMPLETE_FLAG = 'Y'
where RunID = <RunID(s)>;
```

- Truncate the Recycle RunID table and insert your RunID(s):

```
truncate table EDINETCLAIM_PROCESS.dbo.Recycle_RunID;
insert into EDINETCLAIM_PROCESS.dbo.Recycle_RunID values (<RunIDs>);
```

- The AUTO_KEYWORD_RECYCLE job is scheduled to run daily at 6am. This job, however, only picks up claims that are two days old. To avoid unnecessarily aging the claims, you will need to:
  - Wait until CFT302B_3D00_EDINETCLAIM_PROCESS_DATA_MOVE is completed for the day.
  - Queue a new instance of CFT305D_1D00_AUTO_KEYWORD_RECYCLE_RUNID

Running the Keyword

The keyword generation is performed via Informatica workflow. The workflow is:

Integration Service: IS_AGP

Folder: CS_KWD

Workflow: wf_EDINETClaim_XC_parallel

DEV/QA

Prior to running the keyword, you will need to update the KEYWORD_RUNID table so that only your RUNID is processed. Every RunID processed adds time to the overall processing time, and will combine claims from multiple RunIDs into a single .KWD file.

- In the EDINETCLAIM database, run the following:

```
update EDINETCLAIM_PROCESS.dbo.KEYWORD_RUNID
set complete_flag = 'Y';
then
update EDINETCLAIM_PROCESS.dbo.KEYWORD_RUNID
set complete_flag = 'N'
where runid in (<RunID>);
```

  Only the 'N's are processed by the workflow.

- Once updated, run the wf_EDINETClaim_XC_parallel workflow.
- The .kwd file is written to the following output folders:

  DEV: \\agpcorp\apps\Informatica95\dev\ProcessFolders\CS_KWD\TgtFiles

  QA: \\agpcorp\apps\Informatica95\qa\ProcessFolders\CS_KWD\TgtFiles (

  PROD: \\agpcorp\apps\Informatica95\prod\ProcessFolders\CS_KWD\TgtFiles

- Stage the keyword file in the appropriate folder. Here's the general formula:

Environment	Folder
PROD FAC1P, FAC2X	\\agpcorp\apps\Facets\Prod\TZG\Files\<ENV>\INBOUND\KWD\CLAIMS

QA FAC1Q, FAC1T, FAC2Q, FAC2X,FAC3Q, FAC4Q, FAC5Q, FAC6QFAC7Q	\\agpcorp\apps\Facets\QA\TZG\Files\<ENV>\INBOUND\KWD\CLAIMS\INPUT
DEV FAC1D, FAC1I, FAC1L, FAC1X, FAC2D, FAC2L, FAC2X, FAC3D, FAC3L, FAC4D, FAC4L, FAC5D, FAC6D, FAC7D, FAC8D	\\agpcorp\apps\Facets\DEV\TZG\Files\<ENV>\INBOUND\KWD\CLAIMS\INPUT

- Once the .kwd file is staged, run Tidal Job CLA002_0010_FAC_XxXX_FA_ErCmcRunXC00. Tidal request ticket text below:

CLA002_0010_FAC_XxXX_FA_ErCmcRunXC00
*Please insert a new instance of job CLA002_0010_FAC_XxXX_FA_ErCmcRunXC00 into Tidal QA schedule ensuring the environment and agent is set for **<ENVIRONMENT>**. Please override dependencies if needed. Thanks*

- Next, run Tidal Job CLA005_0010_FAC_TxXX_ErCmcRunCLMU_PART1.

*Please insert a new instance of job CLA005_0010_FAC_TxXX_ErCmcRunCLMU_PART1 in Tidal QA schedule ensuring the environment and agent is set for **<ENVIRONMENT>**. Once inserted, please update the command parameters to the below. Once inserted and updated please override dependencies to start the job. Thanks*

<FaGen0 Facets Exec File.51>

*--Region=**<ENVIRONMENT>***

--runbook=ErCmcRunClmu.xml

--NumberOfEnginesClmu=12

--MaxClaimsPerQue=100

--StopStep=7000

--BypassStep=2100

--BypassStep=2200

*--BatchId=**<BatchID>***

--ItsCloseEngineLilError=Y

--BypassBCBSProcessITS=N

--ItsXith0IniPath=D:\TriZetto\Facets\System\Config\ITS_UAT

Where BatchID can be found in the T837StatusLog table.

```
select RunID, BatchID
from T837StatusLog
where RunID = <RunID>
```
